### Summary of Database Report

Our group worked on a small database application for a tire shop. The database is used to track employees, customers and orders. Our reports are shared and are used as a time clock for employees to clock in and out. Each employee has their own clock ID number and with this information you can see what time the employee arrived, took a lunch and clocked out. It also shows their daily total hours worked. Another thing that you can view on our report is customer information and order information which help keep track of orders and customer information. The database has customer basic information such as first name, last name, mailing address, phone number and email address.

The database can also create invoices. On the invoice you will see the customer ID along with the basic information that we have in our database. It will also show the service provided and price per unit.
