### Summar of Database Report

Our group decided to make a database for a small tire installation shop. The database was created to help the tire shop track information regarding customers, employees, orders, and invoices. There are tables containing all the customer information, employee information, and order details. There are also interactive forms for employees to use as a time clock to punch in and out for work, as well as forms to input new customers, and new orders.

All these forms and tables are related to each other, so everything gets updated accordingly. There are reports posted on the web page from our access database. They are reports for employee information, their names and contact information. There are reports for order invoices to see what customers have ordered in the past and whether their bill is paid or not yet. Lastly, there is reports for the time clock form that employees use to punch in and out. Management can see the forms and see any missed punches or late punches.
