MS Access Database Group Project

Summary of Database Report

For our group project, my group decided to make a database for a tire shop. In our database, we have four tabs—tables, queries, forms, and reports—that we can use to track our customers, employees, and orders. For reports, we have a time clock that can track work hours. We also have reports on customer invoices to track their orders as well. Our database also contains forms that are interactive to input new customer information, new order information, and to act as a time clock for punching in and out of work.
