

# Patterns #6

## Introduction to recursive sequences

### Exercise

You are tiling walkways using  $1 \times 2$  tiles (pictured below). When you use the tiles, you can lay them horizontally or vertically.

$1 \times 2$  tile

We're curious how many different ways we could tile certain walkways. For example, if we want to tile a  $2 \times 2$  walkway, there are *two* ways to do it (pictured below).

Tiling 1

Tiling 2

1. How many ways are there to tile a  $2 \times 3$  walkway? Sketch them out.

$3 \times 2$  walkway

2. How about a  $2 \times 4$  walkway?

$4 \times 2$  walkway

3. How about a 2 x 5 walkway?

5 x 2 walkway

4. Let's define a sequence  $t_n$  where  $t_n$  tells us the number of ways to tile a  $2 \times n$  walkway. Use the work above to fill in the table below for  $n = 2, 3, 4, 5$ . Then look for a pattern in the numbers, and use it to complete the rest of table. What is the pattern?

$n$		<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>	<b>9</b>	<b>10</b>
$t_n$										

5. Can you explain the pattern you see in the numbers by connecting the ways to tile a  $2 \times 6$  walkway with the ways to tile the smaller walkways? Generalize this to  $2 \times n$ .
