

Section 4 — Congruences

AKA Modular Arithmetic

Q: If the hour hand is pointing at 9, what will it be pointing at in 5 hours?

So on a clock: $9 + 5 \equiv 2 \pmod{12}$

Also: $5 + 12 \equiv 5 \pmod{12}$

Also: $5 + 24 \equiv 5 \pmod{12}$

* we are reducing multiples of 12 to 0

Q: Let's call Monday the 1st day of the week. If today is the third day of the week (Wednesday), what day of the week will it be in 9 days?

So here: $3 + 9 \equiv 5 \pmod{7}$

Also: $3 + 7 \equiv 3 \pmod{7}$

Also: $3 + 14 \equiv 3 \pmod{7}$

* we are reducing multiples of 7 to 0

Towards a definition...

mod 12

$14 = 2 + 12 \iff 14 - 2 = 12$

$23 = 11 + 12 \iff 23 - 11 = 12$

$27 = 3 + 24 \iff 27 - 3 = 24$

(Note: A green arrow points from the expression "9+5" above to the circled "2" in the first equation.)

Def Let m be a positive integer. Let $a, b \in \mathbb{Z}$. We write $a \equiv b \pmod{m}$ if $m \mid (a-b)$. We read this "a is congruent to b modulo m."

* $a \equiv b \pmod{m} \iff a-b = k \cdot m$ for some $k \in \mathbb{Z}$ Theorem 1
 $\iff a = b + km$ for some $k \in \mathbb{Z}$
 \iff a and b differ by a multiple of m.

Ex T/F - explain

- (a) $26 \equiv 2 \pmod{12}$ T, $12 \nmid (26-2)$
- (b) $2 \equiv 26 \pmod{12}$
- (c) $26 \equiv 2 \pmod{7}$
- (d) $26 \equiv -2 \pmod{7}$
- (e) $35 \equiv 0 \pmod{7}$
- (f) $7^2 \equiv 1 \pmod{3}$

Ex Find all a s.t. $a \equiv 2 \pmod{3}$

$$a \equiv 2 \pmod{3} \iff a = 2 + 3k \text{ for } k \in \mathbb{Z}$$

Ans. all numbers of the form $a = 2 + 3k$ for $k \in \mathbb{Z}$

OR all numbers that are 2 more than a multiple of 3

More concretely

k	...	-1	0	1	2	...
a		-1	2	5	8	

Ex Make a number line from -10 to 10.

- label all numbers cong. to 0 mod 3 in green.
- " " " " " 1 " " " blue
- " " " " " 2 " " " red.

! Note that every number has one and only one color.

Theorem 2 If $n \in \mathbb{Z}$, then n is congruent modulo m to exactly one of $0, 1, \dots, m-1$. This number is called the least residue modulo m .

* In previous example, this says that every integer is either 0 (green), 1 (blue), or 2 (red) modulo 3.

pf Let $n \in \mathbb{Z}$. By the division algorithm, $n = qm + r$ for $q, r \in \mathbb{Z}$ with $0 \leq r < m-1$. Thus, $n = r + qm$, so $n \equiv r \pmod{m}$. \square

Ex Find the least residue of 71 modulo 2? mod 5? mod 11?

$$\begin{array}{r} 35 \\ 2 \overline{) 71} \\ \underline{70} \\ 1 \end{array}$$

Ex Find the least residue of each of the following modulo 3:
31, 30, 63, 7, 11.

Theorem 3 $a \equiv b \pmod{m} \iff$ a and b have the same least residue modulo m (i.e. if they have the same remainder on division by m).

pf book.

Ex T/F $79 \equiv 123 \pmod{11}$

Two approaches:

① The def. $79 \equiv 123 \pmod{11} \iff 11 \mid (79 - 123)$
 $\iff 11 \mid -44$

TRUE

② Theorem 3 $79 \equiv 2 \pmod{11}$ *least residue*

$123 \equiv 2 \pmod{11}$

same least residue

so **TRUE**

Some Properties of Congruence

* Congruence behaves in many ways like equality.

Lemma 1 Let $m \in \mathbb{Z}^+$. Let $a, b, c, d \in \mathbb{Z}$.

$\equiv \pmod{m}$
is an
equiv.
relation

- (a) $a \equiv a \pmod{m}$
- (b) $a \equiv b \pmod{m} \iff b \equiv a \pmod{m}$
- (c) $[a \equiv b \pmod{m} \text{ AND } b \equiv c \pmod{m}] \implies a \equiv c \pmod{m}$
- (d, e) $[a \equiv_m b \text{ AND } c \equiv_m d] \implies a+c \equiv_m b+d \text{ AND } ac \equiv_m bd$

pf (of some)

(c) Assume $a \equiv_m b$ and $b \equiv_m c$. WTS $m \mid (a-c)$.

$\left. \begin{array}{l} \bullet a \equiv_m b \implies m \mid (a-b) \\ \bullet b \equiv_m c \implies m \mid (b-c) \end{array} \right\} \implies m \mid [(a-b) + (b-c)]$

Thus $m \mid (a-c)$, so $a \equiv_m c$ (by definition).

(d) Assume $a \equiv_m b$ AND $c \equiv_m d$. WTS $m \mid [(a+c) - (b+d)]$

$\left. \begin{array}{l} \bullet m \mid (a-b) \\ \bullet m \mid (c-d) \end{array} \right\} \implies m \mid (a-b + c-d)$

Thus, $m \mid [a+c - (b+d)]$, so $a+c \equiv_m b+d$. \square

Ex In each case, find the least residue of a mod 7.

(a) $a = 17 + 700 \cdot 53$

$$17 + 700 \cdot 53 \equiv 17 + 0 \cdot 53 \pmod{7}$$

$$\equiv 17$$

$$\equiv \boxed{3}$$

(b) $a = 8^7$

(c) $a = 6^7$

$$6 \equiv -1$$

(d) $a = 2^{300}$

$$(2^3)^{100} \equiv 1^{100}$$

(e) $a = 2^{301} + 5$

$$2^{300} \cdot 2^1 \equiv 2 \dots$$

Ex Find all solutions to each of the following

(a) $2x \equiv 4 \pmod{6}$

can't just cancel

$$x \equiv 2$$

$$x \equiv 5$$

anything else — let's check
 $(2x \equiv 4 \equiv -2 \Rightarrow x \equiv -1 \equiv 5)$

x	2x
0	0
1	2
2	4
3	6 $\equiv 0$
4	8 $\equiv 2$
5	10 $\equiv 4$

(b) $2x \equiv 4 \pmod{5}$

check

(c) $x^2 \equiv -1 \pmod{5} \quad (-1 \equiv 4)$

that should be surprising (no solution in \mathbb{Z})

⚠ we can not always cancel

⚠ using a table can be effective

will be used later ALOT!

Theorem 4 (cancellation mod m) If $ac \equiv bc \pmod{m}$ AND if $(c, m) = 1$, then $a \equiv b \pmod{m}$

* in words: you can cancel numbers that are relatively prime to the modulus

pf $ac \equiv bc \pmod{m} \Rightarrow m \mid (ac - bc) \Rightarrow m \mid c(a - b)$
 $\Rightarrow m \mid (a - b) \Rightarrow a \equiv b \pmod{m} \quad \square$

Thm 5 - Sect. 1

So what if $(c,m) \neq 1$?

Theorem 5 If $ac \equiv bc \pmod{m}$ and $(c,m) = d$, then
 $a \equiv b \pmod{m/d}$.

* you can always cancel if you change the modulus

Ex (take 2) Find all solutions to

$$2x \equiv 4 \pmod{6}$$

• Theorem 5 $\Rightarrow x \equiv 2 \pmod{3}$

• Back to mod 6

$$x \equiv 2 \pmod{3} \Rightarrow x \equiv 2 \text{ or } 5 \pmod{6}$$

$x \pmod{6}$	$x \pmod{3}$
0	0
1	1
2	2 ✓
3	0
4	1
5	2 ✓

Applications — Divisibility Checks

Ex Show that, for any $k \in \mathbb{Z}^+$, $9^k - 1$ is divisible by 8.

Let $a = 9^k - 1$. Note: $8|a \Leftrightarrow a \equiv 0 \pmod{8}$.

observe: $a = 9^k - 1 \equiv 1^k - 1 = 0 \pmod{8}$. Thus $8|a$.

Ex Show that $71534 \equiv 7+1+5+3+4 \pmod{3}$

This is the idea behind...

Thm An integer is divisible by 3 \iff the sum of its digits is divisible by 3.

Remember that

$$71534 = 7 \cdot 10^4 + 1 \cdot 10^3 + 5 \cdot 10^2 + 3 \cdot 10^1 + 4 \cdot 10^0$$

So if we say $d_k d_{k-1} \dots d_1 d_0$ are the digits of n , we mean

$$n = d_k \cdot 10^k + d_{k-1} \cdot 10^{k-1} + \dots + d_1 \cdot 10 + d_0$$

pf

write $n = d_k \cdot 10^k + \dots + d_1 \cdot 10 + d_0$.

$$\text{Then } n \equiv d_k 1^k + \dots + d_1 1 + d_0 \pmod{3}$$

$$n \equiv d_k + \dots + d_1 + d_0 \pmod{3}.$$

Now,

$$3 | n \iff n \equiv 0 \pmod{3}$$

$$\iff d_k + \dots + d_1 + d_0 \equiv 0 \pmod{3}$$

$$\iff 3 | d_k + \dots + d_1 + d_0 \quad \square$$

Thm An integer is divisible by 11 \iff the alternating sum of its digits is divisible by 11.

Ex T/F : $11 \mid 73451$? $11 \mid 83556$?

Another application

Ex Find the least residue of each mod 10 : 81, 273, 1752. Notice anything?

Lemma Let $n \in \mathbb{Z}$ and let d_0 be the ones digit of n . Then $n \equiv d_0 \pmod{10}$.

Prf $n = d_k 10^k + \dots + d_1 10 + d_0$ where d_k, \dots, d_0 are the digits of n . Thus $n \equiv d_0 \pmod{10}$. \square

Q: what are the square integers?

0, 1, 4, 9, 16, 25, 36, 49, 64, ...

Q: Is it possible that (give me 5 #s...) 723458 is a square? No

Thm If $n \in \mathbb{Z}$ and n is a square, then the last digit of n is one of 0, 1, 4, 5, 6, 9.

Prf Assume $n = m^2$. Thus $n \equiv m^2 \pmod{10}$, what are the squares mod 10?

m	$m^2 \pmod{10}$
0	0
1	1
2	4
3	9
4	$16 \equiv 6$
5	$25 \equiv 5$
$-4 \equiv 6$	$16 \equiv 6$
$-3 \equiv 7$	9
$-2 \equiv 8$	4
$-1 \equiv 9$	1

$\Rightarrow n \equiv 0, 1, 4, 5, 6, 9 \pmod{10}$

\Rightarrow last digit of n is

0, 1, 4, 5, 6, 9 by previous lemma.

\square
